Δ5. Η απόσταση ΚΓ είναι $(ΚΓ) = \frac{L}{2} - \frac{L}{3} = \frac{L}{6}$

Τα δύο σώματα ασκούν στη ράβδο κατακόρυφη δύναμη $N_{1,2}$ που έχει μέτρο ίσο με το ολικό βάρος τους $(m_1+m_2)g$.

$$\Sigma\tau_{(\Gamma)} = 0 \Rightarrow T\left(L - \frac{L}{6} - \frac{L}{3}\right) =$$

$$Mg\frac{L}{6} + (m_1 + m_2)g\left(\frac{L}{6} - x\right) \Rightarrow$$

$$T = \frac{100}{3} - \frac{100}{3}x \quad (\text{S.I.}), \quad -1\text{m} \leq x \leq 1\text{m}$$

Η ράβδος δεν ανατρέπεται γιατί το νήμα δε λυγίζει καθώς για την τάση του ισχύει διαρκώς $T \geq 0$.

Το διάγραμμα της τάσης του νήματος σε συνάρτηση με την απομάκρυνση δίνεται στο διπλανό σχήμα.
